SITE ANALYSIS

Street activity and the drainage channel: photographic survey

URBAN MORPHOLOGY

Dense, fine-grain fabric of small plots and narrow lanes. Little open space inside the blocks, so the streets carry most daily activity.

DRAINAGE CHANNEL

The open channel (blue) runs through the site as a continuous line. Its edges switch between green verges and strips used for dumping.

COMMERCIAL FRONTAGE

Shops, kiosks and vegetable carts gather on the main roads and at junctions, forming small informal activity nodes.

Fig. 1 Observation map

WORKSHOPS AND STORAGE

Sheds with large metal doors and open yards show light industry and storage mixed into the housing.

WASTE

Refuse collects on vacant plots, at wall bases and along the channel, on edges with no clear owner or use.

OPEN GROUND

The large unbuilt land to the east is used for loading and parking. It is the main open space left in the area.
